# Quantitative Information on Foreign Multinationals in Hawaii 

Eric D. Ramstetter, April 1998*

1. Introduction

This paper examines the quantitative information that is available on foreign multinational firms in Hawaii in recent years. The primary purpose of the paper is a very mundane one, to arrange quantitative information on foreign multinationals in Hawaii in a logical and economically meaningful manner so that policy makers can make better informed decisions. In this respect, it is important to note that some of the quantitative information that has heretofore been relied on by policy makers in Hawaii (e.g., State of Hawaii 1995a) is seriously flawed. Namely, quantitative information underlying the estimates in State of Hawaii (1995a) are compiled from published accounts. Consequently, both sampling techniques and the definition of investment employed in the collection of quantitative information are not standard or uniform. This makes the figures that have been published on foreign investment in this publication highly questionable. ${ }^{1}$

There are at least two sources of quantitative information which do not have these sampling and/or defi nitional problems. In this respect, by far the most comprehensive and standardized sources of quantitative information on foreign multinationals in the state is a set of reports based on surveys of foreign multinationals that are conducted and published by the Bureau of Economic Analysis (BEA) of the U.S. Department of Commerce in Washington. These surveys are comprehensive in coverage (they are mandatory for foreign multinationals above a certain size) and use standard definitions for quantitative information. Thus, the sampling and definitional problems present in the quantitative information in State of Hawaii (1995a) are

[^0]generally not present in the BEA surveys.
There are two types of survey information published by the BEA. First the BEA has conducted its own annual surveys of affiliates of foreign multinationals and published the results all years since 1977 (U.S. Department of Commerce 1990, 1995, various years). It is important to emphasize that these surveys and related data are compiled by enterprise (i.e., firm), not by establishment (i.e., factory). Since these data are published annually, they by far the most useful data for general analysis of how activities of foreign multinationals in Hawaii have changed over time. Indicators from this compilation are presented and discussed in section 3 of this paper. Second, for 1987 and 1992 economic censuses, the BEA has used information collected in its annual surveys to identify foreign-owned establishments that are covered in the economic censuses that are conducted by the Bureau of Census every five years. The data from the economic censuses are then reclassified by various foreign ownership categories. Here it is important to emphasize that these data may display very different trends or patterns than the annual survey data because they are compiled by establishment, not by enterprise. Indicators from this compilation are presented and discussed in section 4 of this paper.

There is another source which uses relatively standardized definitions to compile information on sales and employment in large firms in Hawaii, including foreign multinationals, Hawaii Business (various years). Although this source uses relatively standardized definitions for the indicators collected, the samples are not comprehensive, even for large firms, as it is impossible to gather indicators for some firms. Nonetheless, these samples appear to cover most large foreign multinationals for many years and it is thus instructive to look at these data as well. This data set is the subject of section 5 .

Finally, the major conclusions of the analysis are summarized and recommendations for the State of Hawaii's maintenance of quantitative information on foreign multinationals are made in the last section. However, before turning to the details on the quantitative data, it is also helpful to get some idea of why economists are interested in foreign multinationals. This is the subject of section 2 .

## 2. Why are Economists Interested in Foreign Multinationals? ${ }^{2}$

Much of the interest in the activities of foreign multinationals derives from political considerations. These concerns range from valid national security concerns to unwarranted attempts to make foreigners scapegoats for the problems created by U.S. citizens. Despite the high profile sometimes accorded such politically-based concerns, the focus here is on a set of generally much less conspicuous economic problems. These economic problems are sometimes related to politically-based concerns, but it is important for the reader to understand that the following discussion focuses on the economist's perspective and largely ignores political concerns.

The first step here is to clearly define what is meant by a multinational corporation (referred to as an MNC below). For the purposes of this chapter an MNC is defined as a firm with operations in two or more countries. Statistically, a foreign MNC is a company with a foreign ownership share that exceeds a given threshold. This definition can be ambiguous in important respects. For example, ownership cutoffs differ among reporting economies and even among different data sources for one reporting economy. In the United States, a cutoff of 10 percent is generally used. When joint ventures (firms with more than one owner) are involved, especially when no one owner has majority control, any ownership criterion can become ambiguous, especially when trying distinguish among groups of foreign owners. In addition, some firms classified as foreign MNCs may actually be better classified as local firms as their only operations may be in the local economy (e.g., a British national may own a company in the United States but have no business interests outside the United States). Moreover, this definition of an MNC does not distinguish between types of MNCs, nor does it encompass the vast array of non-ownership based international relationships (e.g., international subcontracting of various types) that exist among firms. Correspondingly, there may be important distinctions between affiliates of MNCs established through mergers and acquisitions and affiliates formed through the formation of new affiliates, between investments in expanding the operation of previously existing affiliates and investments in the establishment of new affiliates, or between wholly-foreign owned affiliates and joint ventures. It is important to note that the vast majority of quantitative information on foreign MNCs in the United States says nothing about these differences. In short, what is of most interest here, and what is of most

[^1]fundamental importance to the economic analysis of MNCs, is the distinction between whether a firm has operations in one economy or whether it has operations in two or more economies.

Correspondingly, the economic theory of the multinational corporation focuses first and foremost on the question of why a firm chooses to become a multinational and incur costs of cross-border operations not incurred by non-MNCs. Very simply put, the answer to this question is commonly thought to lie in identifying the advantages that MNCs have that allow them to overcome the disadvantages presented by the incurrence of additional costs of operating across international borders. The interested reader is encouraged to see more comprehensive surveys of this literature (e.g., Caves 1996 and Dunning 1993) but here I will try to summarize the three sets of advantages are often hypothesized in this regard.

The first set consists of advantages accruing from exploitation of assets that belong to a given firm. These assets are often called firm-specific assets and advantages accruing from the possession of such assets are called ownership advantages. Important examples of such firm-specific assets are patents, in-house research capability, and exclusive marketing networks. The intangible nature of such assets is often emphasized in comparison to the tangible nature of fixed assets (e.g., buildings, machinery).

The second set of advantages are advantages accruing from the internalization of economic transactions within a single firm unit. These advantages are called internalization advantages. For example, a firm can often reduce costs associated with a given transaction when uncertainty makes inter-firm transactions risky and thus costly. A good example of this is to suppose that a firm develops a very advanced semiconductor that can greatly improve the performance of a personal computer. However, in such cases there is often a problem of asymmetric information, namely that the firm developing the semiconductor will know far more about its capabilities than any perspective buyer. This will lead to a tendency for the perspective buyer to undervalue the semiconductor from the perspective of the developer and create a motive for the developer to also produce personal computers using the semiconductor in an attempt to extract (what the developer perceives as) the full value from its development efforts. Another example is the problem of lemons in subcontracting, when quality is very important to a final goods producer (e.g., a personal computer company). The final goods producer will be very reluctant to purchase an intermediate goods supplier (e.g., a subcontractor), unless it is assured that its concerns about quality control will be addressed by the supplier. Moreover, the firm producing the intermediate good may have a smaller incentive to emphasize quality than the final good producer. If this is
the case, the final good producer may have to produce the intermediate good itself rather than buying that it from a supplier. Both of these are examples where transactions that would take place in arms-length markets may end up internalized within a single firm. The existence such internalization advantages is often thought to be a major reason for the existence of MNCs.

The third set consists of advantages accrue from operating in a specific location or locational advantages. Traditional examples of locational advantages are reductions in the costs of serving markets when firms are faced with high levels of trade protection in the target market and reductions in production costs afforded by increased access to lower cost factors of production (e.g., labor and natural resources).

Together these elements comprise Dunning's OLI (ownership-location-internalization) paradigm (e.g., Dunning 1993). There is an extensive theoretical debate over whether all of these advantages are a necessary condition for a firm to become a multinational (and thus for FDI to occur) with some arguing that internalization advantages alone are sufficient to explain the existence of the multinational firm (e.g., Buckley and Casson 1991, Rugman 1985). However, from an empirical point of view, I think the general agreement that MNCs tend to possess a distinctive set of firm-specific, intangible assets is important, whether or not such assets are necessary for a firm to become a multinational. The possession of distinctive firm-specific, intangible assets is important because it implies that behavior of MNCs differs systematically from the behavior of nonMNCs. More specifically, there are at least three interrelated sets of firm-specific, intangible assets that foreign firms are thought to possess in relatively large amounts, production technology, marketing networks, and management know-how.

The possession of superior production technology (and superior management know-how) implies that MNCs tend to be more efficient than non-MNCs. One simple example lending support to this proposition is the casual observation that foreign MNC shares of host country of production in developing economies, where there are relatively few home-based MNCs, often tend to be larger than corresponding shares of employment. In other words, the average product of labor (=production per worker) often tends to be relatively high in foreign MNCs in these economies. In addition, the relatively sophisticated marketing networks of MNCs, particularly those related to international trade, also lead to the expectation that MNCs will be more dependent on trade than non-MNCs. This proposition is again supported by the casual observation that foreign MNC shares of host country exports often tend to be much larger than shares of production and employment in
developing economies, or in other words, that trade propensities (e.g., export-sales ratios or ratios of imports to total inputs) are higher in foreign MNCs than in local firms in these economies. These are of course only two dimensions of possible comparisons and there are many more.

Comparing foreign MNCs and local firms in Hawaii is potentially more complex because a more sophisticated economy such as Hawaii (or other U.S. states) is likely to have a relatively large number of homebased MNCs itself. Hence a simple comparison of foreign MNCs and local-based firms may reveal relatively few differences. In this respect, it is important to emphasize that more important economic distinction is between MNCs and non-MNCs, not between foreign firms and local firms. In other words, nationality is in and of itself of less economic concern than whether a firm operates in more than one economy. Of course the two issues are often related and nationality is often of paramount political importance as noted above. However, it is worth reemphasizing that nationality generally of secondary economic importance in that a local MNC is much more likely to resemble a foreign MNC than a local non-MNC. Similarly one would expect that differences among different nationalities of foreign MNCs would be less pervasive than differences between MNCs and non-MNCs.

Moreover, before one can embark on the task of comparing foreign MNCs and local firms it is first necessary to measure activities of both the foreign MNCs and local firms in a consistent manner. Hence, the following sections outline quantitative measures of economic performance available for foreign MNCs in Hawaii.
3. Nonbank Affiliates of Foreign Multinationals Classified by Enterprise, 1977-1995

As indicated in the introduction the annual enterprise-based (firm-based) compilations of the BEA surveys are the sources of the most comprehensive information on foreign MNCs in Hawaii available in time series. However, this does not mean that these data are not subject to shortcomings. First, the major drawback is that the surveys only include two major indicators disaggregated by state, gross property, plant, and equipment (i.e., a measure of fixed capital) and employment, as well as the underlying sample sizes. Second, the data are slow to be published as preliminary estimates from the surveys only become available in the summer two calendar years after the year for which data refers (e.g., preliminary 1995 data became available in

July 1997), and it is necessary to wait yet another year for revised estimates. It is also important to note that the revisions are sometimes substantial. Third, as with any survey, there are important changes in format over time, with the biggest changes in this case coming with the benchmark survey in 1987. Hence there are important differences in classifications by country and industry for 1977-1986 and for 1987-1995. ${ }^{3}$ Fourth, it is perhaps most important to emphasize that these surveys use the enterprise (i.e., the firm) as the basic accounting unit. This means that large diversified firms must be classified in one particular industry even though that firm may be engaged in activities in several industries. Accordingly, there are often large differences between this firmbased industry classification and industry classifications that use the enterprise (i.e., the plant) as the basic accounting unit (e.g., the economic census). ${ }^{4}$ Finally, there are two more minor drawbacks in that the data cover only nonbank affiliates and that data for categories with small numbers of affiliates are often suppressed.

Tables 1-2 summarize the most basic information available on gross property, plant, and equipment (referred to as GPPE below) and employment classified by industry of affiliate. In the case of GPPE, both the total stock and the flow (i.e., the first difference) are presented in Table 1. Here it should be emphasized that these figures refer to gross book values, not to more commonly used measures of fixed capital stocks in current or real values. Moreover, in that these numbers refer to the asset side of a corporate balance sheet, they bear no direct relationship to the stocks or flows of foreign direct investment, which is a liability-based concept. ${ }^{5}$

Looking first at the aggregate trends over time, it is first seen that trends in GPPE stocks, GPPE flows, and employment can all be divided into three roughly equivalent periods (Tables 1-2). The first period is 19771986, a period that was characterized by relatively low, but steadily increasing levels of GPPE stocks and

[^2]employment, though there were apparently some more pronounced fluctuations in GPPE flows. ${ }^{6}$ Over the period, GPPE stocks increased 3-fold, from $\$ 0.67$ billion in 1977 to $\$ 2.01$ billion in 1986 and employment increased 1.6-fold, from 11 thousand to 18 thousand. The second period, 1986-1991/92 was one of rapid increases in both GPPE stocks and employment. GPPE stocks increased 7.7-fold between 1986 and 1992 reaching $\$ 15.4$ billion in the latter year. Employment peaked a year earlier in 1991 at 56 thousand, representing a 3-fold increase over 1986. As will be shown in section 5 below, much of this unusually large increase apparently resulted from foreign buyouts of large U.S. firms in Hawaii during this period. The third period, 1991/92-1995, is one of stagnation and decline in foreign MNC activity in Hawaii. During 1992-1995, the stock of GPPE increased only 4 percent for the whole period, and the flow of GPPE may have been negative in 1995, though some caution is necessary here as the 1995 figure is still preliminary. Employment in foreign MNCs fell 11 percent between 1991 and 1995 to slightly under 50 thousand in the latter year.

By industry, it should come as no surprise that the vast majority of GPPE stocks have been concentrated in industries with strong ties to tourism in the state, namely services and real estate (Tables 1-2). In terms of GPPE stocks, real estate and services were apparently of similar size in 1977-1986. However, services became much larger in subsequent years, the vast majority of this activity apparently in the hotel industry (c.f., section 4 below). Petroleum was very small before 1989, but apparently became the third largest industry in terms of GPPE stocks in 1989 and thereafter due to the Australian takeover of an oil refinery (see section 5). Retail trade was the third largest industry before this takeover and the fourth largest thereafter, followed by wholesale trade and manufacturing. In terms of employment, services is again by far the largest industry. However, due to relatively small labor requirements, real estate and petroleum are much smaller in terms of employment than in terms of GPPE. Correspondingly, retail trade is the second largest industry in terms of employment followed by wholesale trade, manufacturing, or real estate, depending on the year.

In addition to presenting information for Hawaii, Tables 1-2 also present similar information for three West Coast states, California, Oregon, and Washington, and the United States as a whole. A number of interesting contrasts can be observed. First, the shares of services in Hawaii (e.g., 55 percent in terms of GPPE stocks and 49 percent in terms of employment in 1995), are much larger than corresponding shares in these

[^3]other states or the country as a whole (e.g., 5-11 terms of GPPE stocks and 8-21 percent in terms of employment in 1995). Second, the shares of manufacturing and petroleum are much smaller in Hawaii than in these other states or the nation as a whole (e.g., 5 percent versus $34-46$ percent in terms of employment and 2 percent versus 28-52 percent in terms of GPPE stocks in 1995). Another important characteristic shared by Hawaii, Oregon, and Washington is the relatively small share of GPPE stocks in petroleum compared to California and the country as a whole.

Partially as a result of the low shares of petroleum and manufacturing and the large share of services, the industrial structure of foreign MNC activity in Hawaii changed relatively little over time. For example, nationwide the combined share of petroleum and manufacturing in employment fell from 64 percent in 1977 to 48 percent in 1995, while the share of services and other rose from 8 percent to 23 percent. In Hawaii, the latter share also rose some, from 51 percent in 1982 (the first year for which data are disclosed) to 62 percent in 1995, but the scope of the rise was much smaller. In other words, while the rest of the country was experiencing a marked shift in foreign MNC activity from petroleum and manufacturing to services, this change was much less pronounced in Hawaii, largely because the share of services was very large in Hawaii from very early on.

Another marked contrast between Hawaii and the rest of the country is the extent to which Japanese firms dominate the activities of foreign MNCs in Hawaii (Tables 3-4). For example, Japanese owners accounted for 56 percent of all GPPE stocks in 1977 and 84 percent in 1995 but corresponding shares for the country as a whole were only 4 percent and 21 percent, respectively. ${ }^{7}$ In terms of employment, Japanese shares in Hawaii were 64 percent in 1977 and 71 percent in 1995, compared to 6 percent and 15 percent, respectively, for the country as a whole. Thus, like the industry-wise distribution, the country-wise distribution also changed relatively little in Hawaii over time, largely because the share of Japan was very large in Hawaii very early on. Correspondingly, Hawaii has always accounted for relatively large shares of Japanese MNC activity in the United States, for example 4.7 percent in terms of employment and 8.2 percent in terms GPPE stocks in 1995.

[^4]Both of these shares are 9-fold or more larger than Hawaii's share of the country's gross domestic product. ${ }^{8}$ Conversely, while Japan's shares were unusually large in Hawaii, the shares of the two other major inward investors in the United States, Canada and Europe, were unusually low.

Tables 5-6 then show the samples of firms underlying the GPPE and employment data by size of affiliate. Here it is important to note that large size in terms of employment per firm and large size in terms of GPPE per firm do not necessarily correlate. It is also important to note that there are changes in the definitions of the size criteria between 1977-1986 and 1987-1995 as noted in the tables, with changes in the cutoffs for medium-large and large firms in terms of GPPE being relatively large. Moreover, there are a large number of foreign MNCs that report GPPE but have zero employees, mainly real estate investors. In 1995, 32 percent of the foreign MNCs in Hawaii fell into this category compared to a 23 percent for the United States as a whole.

Despite these differences in size distributions and coverage, the two tables reveal a couple of important, similar characteristics with respect to Hawaii. First, the majority of foreign MNCs in Hawaii fall into the small or small-medium groups. Second, there has been a trend toward larger firms with particularly notable growth in the medium-large and large groups through the early 1990s. Conversely, the declines in foreign MNC activity in the mid-1990s appear to have been concentrated in these groups as well.

The final piece of information that has been compiled from the annual BEA surveys is a disaggregation of GPPE stocks into commercial property, that is land and most commercial buildings outside the manufacturing sector (see Table 7 for precise definition) and other items. This table reveals that the over twothirds of the GPPE stocks in foreign MNCs in Hawaii has been commercial property in the 1987-1995 period. This contrasts starkly with the country as a whole where corresponding shares never exceeded 26 percent during this period. It is somewhat interesting that the ratio of commercial property to total GPPE is also relatively high in California at something over one-third.
4. All Affiliates of Foreign Multinationals Classified by Establishment, 1987 and 1992

[^5]One of the major limitations of the annual surveys of foreign MNCs is the fact that they are compiled at the firm level and thus are not directly comparable with data from the economic censuses conducted every five years and related annual surveys which are compiled at the establishment level. In an effort to synchronize these two important data sets, the BEA and the Bureau of the Census have cooperated in efforts to make data from these two sources consistent for years in which the economic census and the benchmark surveys of foreign MNCs are conducted. This project basically involves a recompilation of data from the benchmark survey of foreign MNCs at the establishment level. Data from these compilations are valuable because they allow a direct comparison of data for establishments controlled by foreign MNCs (from the benchmark surveys) and data for all establishments. Furthermore, the publications of these establishment-level data provide far more detail at the state level. First, there is much greater industry-wise detail as well as information simultaneously disaggregated by industry and country of owner for major investors (e.g., Japan, Canada, and major European investors such as the France, Germany, the Netherlands and the United Kingdom). Second, a greater number of indicators, the number of establishments, employment, payroll, and sales, are available.

Tables 8-12 summarize these data for Hawaii in 1987 and 1992, showing the number of establishments, the number of employees, the number of employees per establishment, payroll and payroll per employee, and sales and sales per employee, respectively. Data are shown for most two-digit categories in the Standard Industrial Classification (SIC) and well as three- and four-digit categories for most listed industries in which foreign MNCs were active in Hawaii. Data are also given for all foreign MNCs and Japanese MNCs to the extent available. Moreover, shares of foreign MNCs in all establishments as well as comparisons of foreign establishments and U.S. establishments are also made. Some of the more interesting patterns emerging from these data are summarized below.

First, foreign MNCs accounted for relative small shares of the number of establishments in the state, though there was a rapid increase in the foreign share of all establishments from 1.7 percent in 1987 to 3.6 percent in 1992 (Table 8). As indicated by the data in the previous section, the number of Japanese establishments grew even faster during this period, the Japanese share of all foreign establishments growing from 45 percent to 55 percent during this period. Although the shares of foreign establishments in all establishments were relatively small overall, these shares were relatively large for both years in a number of individual industries, for example land subdividers and developers, manufacturing of stone, clay and glass,
wholesale trade of electrical appliances, etc., luggage and luggage goods stores, hotels and motels, and public golf courses. Of these categories, the last one, hotels and motels, had by far the largest absolute number of foreign establishments. Eating places and a number of other retail trade industries also had a large number of foreign establishments but foreign shares of all establishments were generally smaller. In addition, there were also a large number of industries which had large foreign shares in one of the two years, for example, mining, tour operators, wholesale trade of hardware, etc., chemicals, and petroleum, etc., department stores, miscellaneous general merchandise stores, gas stations, fire, marine, and casualty insurance, subdividers \& developers, membership sports and recreation clubs.

Shares of the number of establishments is not a very good indicator of how important foreign MNCs are to the local economy because MNCs often tend to be relatively large compared to non-MNCs. For example, the shares of foreign MNCs in total employment were a good deal larger than corresponding shares of establishments at 7.2 percent in 1987 and 13.1 percent in 1992 (Table 9). Correspondingly, foreign establishments had an average of 52-58 employees per establishment in these two years, compared to 13 employees per employee in both years in U.S. establishments (Table 10). Japanese establishments also accounted for relatively large shares of employment, 70 percent in 1987 and 68 percent in 1992. There were thus 89 employees per Japanese establishment in 1987 and 65 employees per Japanese establishment in 1992. The hotel and motel industry is by far the largest industry for foreign affiliates in terms of employment, this industry alone accounting for 36 percent of all employment in foreign establishments in 1987 and 40 percent in 1992. Correspondingly, these were relatively large establishments with 270 employees per establishment in 1987 and 329 employees per establishment in 1992. Almost all of these were Japanese hotels and motels. Another industry with relatively large employment in foreign establishments is eating and drinking places, primarily eating places. This industry accounted for 12 percent of all foreign establishment employment in 1987 and 19 percent in 1992, with a little less than half of this being in Japanese establishments in the latter year. However, foreign shares of total employment were actually below average in this industry and the size differential (measured as employees per firm) was relatively small in this industry.

As indicated in section 2 above, MNCs are expected to be more efficient than non-MNCs and as a result they are often observed to have relatively high labor productivity and/or payroll per employee. However, according to the available information on payroll and payroll per employee for foreign establishments in Hawaii
(Table 11), the share of foreign establishments in all payroll was 7.7 percent in 1987, only slightly larger than the corresponding share of employment, 7.2 percent. As a result, payroll per employee in foreign establishments was only 7 percent higher than payroll per employee in U.S. establishments. Unfortunately, a similar comparison is not possible at the aggregate level or for several major industry categories for $1992 .{ }^{9}$ However, comparisons are possible for a number of major industries. By far the largest foreign establishment industry in terms of payroll is again hotels and motels, where the share of foreign establishments in all establishments was about one-third in 1987 and about one-half in 1992. Interestingly, foreign establishments paid higher wages than U.S. establishments in $1987,15,306$ versus 13,165 , but this was reversed in 1992 , 17,991 versus 19,177 . Wholesale trade of durable goods, eating and drinking places, and insurance carriers were also relatively large in terms of payroll in foreign establishments, had a relatively large wage differentials in favor of foreign establishments in 1987, but the large wage differential almost totally disappeared by 1992. The reverse pattern was observed in food manufacturing and automotive dealers with U.S. establishment wages being much higher in 1987 and the differentials decreasing markedly by 1992. Thus, in a number of important industries there was a trend toward reduction or reversal of wage differentials between foreign and U.S. establishments during this period.

In a number of other important industries, large wage differentials persisted or widened. This is observed in transportation services, general merchandise stores, apparel and accessory stores, miscellaneous retail stores, real estate, and amusement and recreation services. The figures for amusement and recreation services are somewhat strange in suggesting that foreign establishments paid unusually high wages in 1992 and I have been told that there is a high probability that this may be the result of foreign establishments employing highly paid sports personnel. Figures are also unusual for luggage and leather goods stores, where the estimate of payroll in foreign establishments is larger than for all U.S. establishments and payroll per employee is thus negative for U.S. establishments, and I am told this is due to a revision of the U.S. total in the Economic
${ }^{9}$ The publication with the foreign establishment data for 1992 (U.S. Department of Commerce 1997) does not include estimates of payroll for all U.S. establishments disaggregated by state. Such data are available from the economic census publications (U.S. Bureau of the Census 1995a, 1995b, 1995c, 1995d, 1995e, 1995f, $1995 \mathrm{~g}, 1995 \mathrm{~h}$ ) but these data often do not match the data on the number of establishments and employment included in the foreign establishment publication. In principle, these figures should match once different classifications of administrative and auxiliary units are taken into account but in practice this researcher had trouble making the totals match even after taking the different classifications into account. Thus, ratios of foreign establishments to all establishments and estimates for U.S. establishments are only given for industries in which the estimates of the number of establishments and employment were identical in the two sources.

Census.

It is even more difficult to match data for sales than for payroll so very few totals or subtotals are available. ${ }^{10}$ Moreover, the 1992 data for foreign firm sales reveal a somewhat different pattern than the employment and payroll data. Namely, finance, insurance, and real estate, not services is the largest industry for foreign establishments, followed closely by retail trade, and then more distantly by services (Table 12). Unfortunately, the lack of corresponding data preclude any comparisons between local and foreign establishments in finance, insurance, and real estate or for the retail trade subtotal in 1992, though it is notable that insurance, like wholesale trade, was characterized by relatively high sales per employee among foreign establishments. Here it should be also noted that sales per employee is at best only a very rough indicator of the average product of labor because the sales indicator includes both value added and intermediate expenditures. Hence higher sales per employee may be indicative of relatively high value added per employee (the more standard measure of the average product of labor) or higher intermediate expenditures per employee. Relatively high sales per employee in wholesale trade, for example, is commonly due in large part to relatively high intermediate expenditures per employee in the industry. In this respect, it is notable that sales per employee is relatively high for both foreign and U.S. establishments in this industry. However, it is of some interest that this indicator tends to be somewhat higher in foreign establishments than in U.S. establishments in the industry.

Turning to the next largest industry in terms of foreign establishment sales, retail trade, foreign establishments accounted for 11 percent of sales in the industry in 1987 and had relatively high sales per employee (Table 12). Comparisons for the industry as a whole are impossible for 1992 but among the 5 major sub-industries for which comparisons are possible, foreign shares grew rapidly in all of them, food stores, automotive dealers, apparel and accessory stores, eating and drinking places, and miscellaneous retail stores. Sales per employee was larger in foreign establishments for both years in apparel and accessory stores and miscellaneous retail stores but lower in both years in food stores and automotive dealers. In eating and drinking

[^6]places there was little difference in 1987 but the figure was about 13 percent higher in local establishments in 1992.

In the service sector, overall comparison is again impossible for 1992 but foreign establishments had higher sales per employee in 1987 and, correspondingly, the foreign share in terms of sales, 14 percent, was somewhat higher than in terms of employment (Table 12). The vast majority of the sales in the industry come from hotels and motels ( 89 percent in 1987 and 83 percent in 1992) and the foreign share of sales in this industry skyrocketed from 35 percent in 1987 to 51 percent in 1992. However, while sales per employee was some 24 larger in foreign establishments in 1987, this differential reversed itself to 4 percent in favor of local establishments in 1992. This reflected the fact that the growth of the foreign share of employment in the industry ( 12 percent to 21 percent, see Table 9 ) was even more rapid than the rapid growth of the foreign share of sales in this important industry.

There were notable differentials in sales per employee in favor of foreign establishments in construction in 1987 and manufacturing in 1992. However, sales per employee in foreign construction establishment actually fell 25 percent by 1992 indicating that the differential in this may have dissipated or reversed itself. In manufacturing the 1992 differential is due primarily to one large oil refinery (see below) and foreign establishments had much lower sales per employee in both years in food products, the only industry for which comparisons are possible in both years.

The comparisons noted above are just some of the things that can be done with this very rich data set. In this respect, it is important to note that much more rigorous comparisons are possible by contracting the BEA to analyze the establishment level data that cannot published due to disclosure requirements. ${ }^{11}$
5. The Largest Foreign Multinationals in Hawaii by Sales, 1984-1996

Having reviewed the official information on foreign multinationals in Hawaii, it is possible to get a general picture of the roles foreign multinationals play. However, the official data are plagued by two nagging

[^7]problems. First, they are quite slow to come out, with preliminary 1995 data just becoming available in August of 1997. Second, there are a number of important categories where data suppression makes it impossible to ascertain patterns and trends, a relatively large problem in a small state like Hawaii. Perhaps the most obvious example of this is the suppression of data on total GPPE stocks for 1981-1983. Fortunately, there are a number of other local Hawaiian sources than can be used to supplement the official data and partially complement the official data. As noted in the introduction, an official state source (State of Hawaii 1995b) is an extremely valuable source of qualitative information on foreign investment-related transactions, though the quantitative information presented is seriously flawed because standard definitions and sampling techniques are not used.

Fortunately, there is a private sector publication, Hawaii Business (various years), which has compiled quantitative information on large firms in Hawaii using more standard definitions and compilation techniques since 1984. Moreover, the publication includes information on parent firms classified by country, making it possible to identify foreign-owned firms. It should be noted that there are cases in which this publication appear to have classified some foreign firms as U.S. firms and some initial cross checking has been done with State of Hawaii (1995b) and Hoover's (1997) to confirm the ownership status of some parents as well as the timing of acquisitions and sales of affiliates in Hawaii. ${ }^{12}$ Some of the more important advantages of using these firm-level data are (1) they are published about a year ahead of the BEA data (e.g., 1996 data were published in August 1997), (2) it is possible to do detailed country by industry compilations without data suppression, and (3) it is possible to track the performance of individual firms across time.

As with all data sets there are problems one faces when using the data, the primary ones being that the sampling technique used, that is gathering data on large firms in Hawaii from all possible sources, is rather ad hoc and thus subject to unknown biases. More specifically, even among large firms, there are a number of firms for which is impossible to gather data for some or all years and it is not clear if or how this might bias the samples. Second, some of the figures are estimates or unconfirmed. In addition, to figures given in the

[^8]publication, this author has also interpolated estimates for some firms and years when data were not available. ${ }^{13}$ Hawaii Business (various years) is itself keenly aware of these coverage and reliability problems and every year stresses the need to use such data with caution and I wish to echo that sentiment here. A third problem in this context is that these data can facilitate compilation of only three indicators, number of firms, sales, and number of employees. A fourth problem is one of industry classification. Many of the firms are involved in activities in several related industries, for example, hotels, restaurants, and tour arrangements, and it is impossible to tell which of these activities is largest from these data. The classification of such firms is based on my perception of which activity is largest and should be reviewed in the future by someone with greater knowledge of these firms and their activities. ${ }^{14}$

However, despite these problems, this source is still thought to be an extremely valuable source of quantitative information that can be used to supplement the BEA data described above. The three indicators that can compiled from this source are presented by country/region and industry for 1974-1996 in Tables 13-15. First, much like the BEA data, these data show a rather steady increase in the number of large foreign firms in Hawaii during this period, with particularly large increases in the mid- to late-1980s (Table 13). The underlying firm-level data highlight that a major source of this increase was the acquisition of existing large firms by foreigners from U.S. owners. For example, between 1985 and 1988, there were 15 known foreign acquisitions from U.S. persons, 9 new foreign firms added to the sample, some of which were probably acquisitions themselves, 1 U.S. acquisition of a foreign firm, and 4 foreign firms that were dropped from the sample, for a net increase of 19 firms. Hence foreign acquisitions were a very important avenue through which foreign presence increased in Hawaii during this period. Second, as suggested by the BEA data, the vast majority of large firms in the state are Japanese, and in recent years they are heavily concentrated in the hotel industry. Not other country/region group had more than 5 large firms in the state during this period.

Japanese firms are also seen to be very important in terms of employment and sales (Tables 14-15). In

[^9]the mid 1980s, however, retail trade was relatively large for large Japanese firms, especially in terms of sales where this industry was actually larger than hotels until 1985. However, since the investment boom of the midto late-1980s, hotels has become by far the largest industry for large Japanese firms, both in terms of sales and employment. These data thus further underlie the importance of Japanese investment in hotels and related industries in the state. ${ }^{15}$

Interestingly, however, these data differ somewhat from the BEA estimates in suggesting that trends in Japanese firms and overall trends diverged somewhat in the late 1980s and early 1990s. Much of this divergence in terms of sales is due to one large oil refinery that was bought by Australia's BHP in the late 1980s (Table 15). In terms of employment, large fluctuations in construction due to the activities of Australian and New Zealand firms in the late 1980s and early 1990s also had significant effects on overall trends (Table 14). However, these data are similar to the BEA data in suggesting that foreign firm activity peaked in 1989-1991 and fell off somewhat thereafter. Interestingly, both the employment and sales figures suggests that there may have been some pick up in foreign activity in 1996, though much of this is due to the inclusion of several new Japanese firms in the sample for this year (Tables 13-15).

## 6. Conclusions and Recommendations

This paper has examined the quantitative information available on the activities of foreign multinational firms in Hawaii using three sources. First, information on gross property, plant, and equipment, as well as employment and underlying sample sizes were assembled from firm-based compilations of annual BEA surveys of foreign MNCs in the United States. It was argued that these data are the most comprehensive and clearly defined data available on an annual basis and that they thus constitute the best source for tracking the activities of foreign MNCs in the state over time and across industries or investing countries. These data showed that Japan and services industries account for a very large share of foreign MNC activity in Hawaii. The data also showed that there was a large increase in this activity in the mid- to late-1980s but that foreign MNC activity has declined somewhat since its peak in the early 1990s.

[^10]The second source of data examined were the establishment-level compilations of the BEA survey data that is done for benchmark survey years (1987 and 1992 so far). These provide much more industry detail as well as two additional indicators of interest, payroll and sales of establishments. Moreover, they are tied to the economic census data which means that direct comparisons of foreign and U.S.-owned establishments are possible. As indicated in Section 2, the facts that (1) the distinction between MNCs and non-MNCs is generally thought to be of greater economic consequence than distinctions between nationality of ownership per se and (2) many U.S.-owned establishments are themselves part of MNCs, mean that differences between foreignowned and U.S.-owned establishments may not that large. However, this remains a point that should be examined empirically. In this respect, it was also noted that much more rigorous comparisons are possible by contracting the BEA to analyze the establishment level data.

Finally, a privately assembled set of data on large foreign firms was examined. Although these data are subject to numerous sampling and quality problems, they also showed the same general patterns that were observed in the BEA data sets above, namely that there was a large increase in the activities of foreign MNCs in the mid- to late-1980s, and that Japanese firms in the hotel industry accounted for a very large portion of this increase. These data also reveal a few large firms owned by Australian and New Zealand interests in oil manufacturing and construction.

As the title of this paper indicates this analysis should be thought of a preliminary in nature. In other words, more rigorous and substantial economic analysis is left for future research. In contrast, a major focus of this paper has been to describe the nature of the data sources available and to illustrate, not to comment on how Hawaii's policies should deal with foreign investors. However, if this observer has an inclination in this respect, it would be to suggest that the most rational way to deal with foreign investors is to treat them as much like U.S. investors as possible, so that they can make rational decisions based on the economic fundamentals in the state. Hawaii should not want or need investments that are made primarily to take advantage of investment incentive schemes as such investments will inevitably lead to unnecessary inefficiencies. On the other hand, Hawaii should also seek to provide a rational and open business environment where restrictions on business are limited to the bare necessities, for example to regulations regarding public safety, the environment, and other areas where market failures are known to exist. It should also be stressed that this viewpoint is derives not so much from examination of the data described above, but from what I would call common sense economics.

Nonetheless, whenever Hawaii implements specific policies it is important to pay attention to how those policies affect individual firms. There are many cases in which well-intentioned policies have unintended effects on firms, both foreign- and U.S.-owned. Moreover, since many of these unintended effects are adverse, it is crucial that policy makers be made more aware of the effects of the policies they implement. In order to increase awareness of these problems vis a vis foreign investors in the state, it is in turn crucial that the state maintain a certain core set of information on the activities of foreign investors, including both qualitative and quantitative information. In the process of compiling this study I have become aware of four potentially important ways in which to improve the relevant information maintained by the State of Hawaii's Department of Business, Economic Development \& Tourism and related agencies.

First, as indicated several times in this paper, the major state publication on foreign investment (e.g., State of Hawaii 1995a) is an extremely valuable source of qualitative information on the acquisitions of foreign investors in the state and it is highly desirable that this publication be updated. However, the quantitative information in the publication is seriously flawed due to sampling and definitional problems. Accordingly, the first recommendation is that the quantitative information presently included in this publication be treated in the same manner as the qualitative information. Specifically, instead of listing investment amounts separately in one column (and thus implying they are all based on a common definition of investment), the amounts should be included in the text using phrases such as "investment was reported to amount to xxx dollars." Correspondingly, tables based on the sums of these reported amounts should be deleted from the publication to avoid misleading the public.

Second, the State of Hawaii should rely on the annual firm-level BEA surveys for official quantitative estimates of foreign affiliate activity in the state in time series. These surveys are very comprehensive in coverage and use standard definitions in the compilation of quantitative indicators. As part of the background work for this paper I have already set up firm-based data sets on gross property, plant, and equipment, and employment, as well as the underlying sample sizes, for 1977-1994 for all states in the country in Excel format. Annual updating of these data sets will be very inexpensive and provide a valuable source of official estimates on the activities of foreign multinationals by state in the country. It is also possible to set up data bases on a few other indicators (see Appendix Table 1 for a summary of data available by state). Compilations of commercial property holdings by industry or country are some potential interest in this respect.

Third, the State of Hawaii could potentially benefit from detailed economic analysis of the activities foreign MNCs using the establishment-level compilations of the BEA surveys in benchmark years and corresponding data on all establishments in Hawaii from the economic census. Some examples of the types of comparison possible were given in Section 4 above, but much more rigorous and detailed analysis is possible, especially if the BEA is contracted to do analysis of unpublished data. However, this is likely to be a relatively expensive exercise and the costs must be weighted against the potential benefits before deciding to spend public funds on this activity.

Fourth and finally, the State of Hawaii may find it beneficial to maintain a very limited set of data on large foreign MNCs in Hawaii based on the information published in Hawaii Business (various years). These data are described in Section 5 and I have set up an Excel data base on these firms for 1984-1996. However, if the State is to use these data, they should first be cross-checked with other published and unpublished sources, a process that may take a much a one month of worker's time. Once the basic data base are cross checked, this data base could be updated and supplemented relatively cheaply in future years.

There are three areas in which it would be desirable to independently check and supplement published firm-level information. First, it is desirable to confirm the accuracy of the published estimates. Second, if a large foreign firm is known to be excluded from the published data, it would be highly desirable to try and gather information from that firm. Third, it would also be helpful to ask for estimates of book values of the stocks of fixed assets to correspond to the measure of GPPE available from BEA. Probably the cheapest (for both the State and the firms involved) and thus the most effective way to do this type of follow up would be by phone. All together updates of the published data and the supplemental phone survey would probably take no more than 10 or 15 minutes for an official from each company and 1 or 2 weeks of a State worker's time each year and would thus be rather inexpensive to implement. There is a potential problem with this proposal however, in that it is not clear that the State of Hawaii would find it appropriate to publish data obtained in this manner. If it were decided that such data could not be published, it may not be worth the expense to implement this proposal.

1995 figures are preliminary; $>\mathrm{x}$ or $<\mathrm{x}=$ greater or less than x (exact figure not disclosed); (D)=not disclosed; n.a. $=$ not available; values between -0.5 and 0.5 are rounded to zero.
a-Stocks are book values as given in the source. Flows are annual change (first differences) of stocks

1995 figures are preliminary; $>\mathrm{x}$ or $<\mathrm{x}=$ greater or less than x (exact figure not disclosed);
$(D)=$ not disclosed; n.a. $=$ not available; values between -0.5 and 0.5 are rounded to zero.
a-Stocks are book values as given in the source. Flows are annual changes (first differences of stocks).
b-Figures for Australia include New Zealand and South Africa for 1977-1986 but exclude these countries for 1987-1995.
c-Figures for Other subtotal include New Zealand and South Africa for 1987-1995 but exclude these countries for 1977-1986. Figures for Other subtotal include Middle East, Africa less
South Africa, Other Asia \& Pacific less New Zealand, and United States for all years.
Sources: U.S. Department of Commerce (1990, 1995, various years).

Values between -0.5 and 0.5 are rounded to zero.
a-Stocks are book values as given in the source. Flows are annual changes (first differences) of stocks.
b-Commercial property is the gross book value of all commercial buildings and associated land owned by the affiliate, including apartment buildings, office buildings, hotels, motels, and buildings used for wholesale, retail, and services trades (e.g., shopping centers, recreational facilities, department stores, bank buildings restaurants, public garages, and automobile service stations).

Appendix Table 2: Establishment Data Available by State from BEA’s Surveys of Nonbank U.S. Affiliates of Foreign Companies for 1987 (tables cover all industries except as noted)

## PART I. OVERVIEW BY INDUSTRY, COUNTRY, AND STATE

Tables for the U.S. as a Whole (note: these tables [1.1 to 1.7] have no state-wise information)
State Tables
1.8. Data for U.S. Affiliates and All U.S. Businesses, by State
1.9. Employment, and Number of Establishments by Employment Size Class, of U.S. Affiliates, by State
1.10. Data for Manufacturing Establishments of U.S. Affiliates and All U.S. Businesses, by State
1.11. Manufacturing Employment, and Number of Manufacturing Establishments by Employment Size Class, of U.S. Affiliates, by State
1.12. Number of Establishments of U.S. Affiliates, State by Selected Industry of Establishment
1.13. Number of Establishments of U.S. Affiliates, State by Country of UBO
1.14. Number of Manufacturing Establishments of U.S. Affiliates, State by Country of UBO
1.15. Employment of U.S. Affiliates, State by Selected Industry of Establishment
1.16. Employment of U.S. Affiliates, State by Country of UBO
1.17. Employment of Manufacturing Establishments of U.S. Affiliates, State by Country of UBO
1.18. Payroll of U.S. Affiliates, State by Selected Industry of Establishment
1.19. Payroll of U.S. Affiliates, State by Country of UBO
1.20. Payroll of Manufacturing Establishments of U.S. Affiliates, State by Country of UBO
1.21. Shipments or Sales of U.S. Affiliates, State by Selected Industry of Establishment
1.22. Shipments or Sales of Manufacturing Establishments of U.S. Affiliates, State by Country of UBO

PART II. INDIVIDUAL STATES: DETAILED INDUSTRY TABLES
2.1. Data for U.S. Affiliates and All U.S. Businesses in Each State, by Detailed Industry of Establishment (data for all 50 states and the District of Columbia)
2.2. Employment, and Number of Establishments by Employment Size Class, of U.S. Affiliates in Each State, by Detailed Industry of Establishment (note: data cover all 50 states and the District of Columbia)

PART III. SELECTED COUNTRIES: DETAILED INDUSTRY AND STATE-BY-INDUSTRY TABLES
3.3. Employment, and Number of Establishments by Employment Size Class, of U.S. Affiliates With UBO's in Major Investing Countries, by State and Detailed Industry of Establishment (note: data cover Canada, France, Germany, Japan, Netherlands, United Kingdom)

Appendix Table 3: Establishment Data Available by State from BEA's Surveys of Nonbank U.S. Affiliates of Foreign Companies for 1992 (tables cover all industries except as noted)

## PART A ALL INDUSTRIES

Group I. Overview by Industry, Country, and State

Detailed Industry and Detailed Country Tables (note: these tables [A1.1, A1.2, A1.7] have no state-wise information)
Country by Industry and Industry by Country Tables (note: these tables [A1.8 to A1.15] have no state-wise information)
State Tables

A1.16. Number, Employment, Payroll, and Value of Shipments or Sales of Foreign-Owned and All U.S. Establishments, by State
A1.17. Employment, and Number by Employment Size Class of Foreign-Owned Establishments, by State

State by Industry and State by Country Tables:
A1.18. Number of Foreign-Owned Establishments, State by Selected Industry
A1.19. Number of Foreign-Owned Establishments, State by Country of UBO
A1.20. Employment of Foreign-Owned Establishments, State by Selected Industry
A1.21. Employment of Foreign-Owned Establishments, State by Country of UBO
A1.22. Payroll of Foreign-Owned Establishments, State by Selected Industry
A1.23. Payroll of Foreign-Owned Establishments, State by Country of UBO
A1.24. Shipments or Sales of Foreign-Owned Establishments, State by Selected Industry
A1.25. Shipments or Sales of Foreign-Owned Establishments, State by Country of UBO

Group II. Individual States: Detailed Industry Tables

A2.1. Number, Employment, Payroll and Shipments or Sales of Foreign-Owned and All U.S. Establishments in Each State, by Detailed Industry
A2.2. Employment, and Number by Employment Size Class, of Foreign-Owned Establishments in Each State, by Detailed Industry

Group III. Selected Countries: Industry and State-by-Industry Tables
A3.1 to A3.7. Number, Employment, Payroll, and Shipments or Sales of $\qquad$ -Owned Establishments, by Industry (for Canada, France, Germany, Netherlands, Switzerland, U.K., Japan; note no state-wise information included) A3.8 to A3.14. Number and Employment of $\qquad$ -Owned Establishments, by Detailed Industry (for Canada, France, Germany, Netherlands, Switzerland, U.K., Japan; note no state-wise information included) A3.15. Number and Employment of Canadian-Owned Establishments, by State and Industry A3.16. Number and Employment of French-Owned Establishments, by State and Industry A3.17. Number and Employment of German-Owned Establishments, by State and Industry A3.18. Number and Employment of Netherlands-Owned Establishments, by State and Industry
A3.19. Number and Employment of Swiss-Owned Establishments, by State and Industry
A3.20. Number and Employment of British-Owned Establishments, by State and Industry
A3.21. Number and Employment of Japanese-Owned Establishments, by State and Industry

[^0]:    *Research Professor, International Centre for the Study of East Asian Development, Kitakyushu, Japan (email 100512.3035@compuserve.com). This first draft of this paper ("Quantitative Information on Foreign Multinationals in Hawaii: Some Preliminary Observations") was written in August 1997 when the author was a consultant to the Department of Business, Economic Development and Tourism (DBEDT), State of Hawaii. Accordingly, the author would like to thank DBEDT, especially Mary E. Blewitt and Pearl Imada-Iboshi, for assistance in compiling data and organizing this report. The author would also like to thank Dale Shannon for comments on the first draft of this paper and to thank both Dale Shannon and Robert E. Lipsey and assistance in understanding the data published by the Bureau of Economic Analysis. However, the author bears sole responsibility all errors as well as all opinions expressed.
    ${ }^{1}$ It should be emphasized that these criticisms apply solely to the quantitative information presented in State of Hawaii (1995a), as the qualitative information provided in the publication is extremely valuable.

[^1]:    ${ }^{2}$ This section is heavily based on Ramstetter (1998, pp. 187-190).

[^2]:    ${ }^{3}$ From Hawaii's point of view the most important change was the addition of a services category from 1987 forward. For previous years, services was combined with other industries. Another important change was in the presentation of data for Australia and New Zealand. For 1986 and previous years data for these two countries were combined with data for South Africa. From 1987 forward, Australia is listed separately but New Zealand is included in Other Asia and Pacific.
    ${ }^{4}$ It should be noted that industry distributions for most tables are in the annual surveys are based on the industry that the affiliate has the largest sales in. However, state distributions differ in that they are based on data reported for each state individually.
    ${ }^{5}$ More specifically, the stock of foreign direct investment consists of equity, loans from related companies, and reinvested earnings, and typically accounts for one-fourth to one-half of the total liabilities of a firm. The stock of GPPE is an item that typically accounts for one-fourth to one-half of the total assets of a firm. Although total assets and total liabilities are equal on a corporate balance sheet, it is important to note that changes in foreign direct investment stocks are often not accompanied by changes in GPPE or other productionrelated variables (e.g., Ramstetter 1998). Furthermore, since foreign direct investment is a balance of payments concept, data on foreign direct investment do not exist at the state level.

[^3]:    ${ }^{6}$ It is difficult to tell exactly how large these fluctuations were due to the suppression of data in the early 1980s.

[^4]:    ${ }^{7}$ Note that all compilations of U.S. data by country are classified by country of ultimate beneficial owner, not country of capital source, that is an investment by a Japanese-owned company located in Hong Kong is counted as investment from Japan, not Hong Kong. Note also that these two classifications can be quite different.

[^5]:    ${ }^{8}$ By contrast Hawaii's gross state product in 1994 was only $\$ 32$ billion (State of Hawaii 1995b) or less than 0.5 percent of the nation's gross domestic product for 1994 ( $\$ 6,947$ billion; see Survey of Current Business, August 1997).

[^6]:    ${ }^{10}$ As with the payroll data, the publication with the foreign establishment data for 1992 (U.S. Department of Commerce 1997) does not include estimates of payroll for all U.S. establishments disaggregated by state. Such data are available from the economic census publications (U.S. Bureau of the Census 1995a, 1995b, 1995c, 1995d, 1995e, 1995f, 1995g, 1995h) but these data often do not match the data on the number of establishments and employment included in U.S. the foreign establishment publication. Thus, here again, ratios of foreign establishments to all establishments and estimates for U.S. establishments are only given for industries in which the estimates of the number of establishments and employment were identical in the two sources. Moreover, a number of subtotals are also unavailable for 1987 (U.S. Department of Commerce 1992).

[^7]:    ${ }^{11}$ Note that the BEA can be contracted to do compilations and/or statistical analysis of establishmentlevel, provided that publication of the results do not compromise disclosure requirements.

[^8]:    ${ }^{12}$ Much of the problem comes when trying to ascertain the country of ultimate beneficial owner when the direct owner is a U.S. corporation which is in turn foreign-owned. Note also that the cross checking that has been completed focused on questionable cases, and that further, more comprehensive cross checking with these and other sources is desirable in the future.

[^9]:    ${ }^{13}$ For example, if a firm's sales were available for years $1,2,4$, and 5 but not for year 3 and it was known that the firm was excluded in year 3 because sales failed to meet the threshold (usually about $\$ 10-\$ 20$ million depending on the year), I estimated the figure for year 3 using this information. Such estimates were added for only a very small number of years and firms.
    ${ }^{14}$ Note also that this source includes data on U.S.-owned firms. However, data for many of the U.S.owned firms, especially those based in Hawaii, apparently include activities outside of the state, making them fundamentally incompatible with data on foreign-owned firms.

[^10]:    ${ }^{15}$ Note that the share of hotels may be somewhat overestimated here due to possible misclassification of large firms involved in the hotel and other industries as noted above.
